

ICIC 2026 Paper # 743 Decision Notification

Dear Author(s),

Congratulations! On behalf of the ICIC 2026 International Program Committee, we are very pleased to inform you that your paper:

Paper ID: 743

Author(s): Ying Fu, Nie Ru, Zhengwei Li, Zhanguo Xia

Title: GCFH-MDA: Graph Collaborative Filtering with Hypergraph Augmentation for miRNA-Drug Association Prediction

Presentation: **Oral**

has been accepted for presentation at the 2026 International Conference on Intelligent Computing, which has been selected into the following Springer –Nature series:

● Lecture Notes in Bioinformatics (LNBI)

This year we received a large volume of paper submissions from **21** countries and regions, and each paper received averagely **3.6** review reports, only a limited number of papers (less than the acceptance rate of 40%) are accepted while a large number of high-quality papers have to be rejected due to the space limitation.

IMPORTANT NOTES:

- Please note that the papers submitted to the ICIC conference should not have been submitted to other conferences at the same time. If multiple submissions were found, the paper will be directly excluded from the conference proceedings. In the meantime, such multiple submission information will be passed to the other involved conferences.
- From previous ICIC2006 & ICIC2009 & ICIC2011 & ICIC2025 proceedings, it can be found that there are several **severe cases of plagiarism**. So we are kindly reminding all the authors to stipulate your academic behavior, and cherish and protect your own reputation as well as our ICIC reputation. We hope not to see this phenomenon in future ICIC academic event. We shall try our best to take every measure to stop this misconduct.

To include your paper in the proceedings to be published by Springer-Nature, here are the steps you must follow:

1. Please see the attached REVIEWERS' COMMENTS for your paper, which are intended to help you to improve your paper for final publication. The listed comments should be fully addressed, as acceptance is conditional on appropriate response to the requirements and comments, which only need to be stated in the final Paper. Unsatisfactory final paper submission may be directly rejected by the editor.

2. Please take a look at Proceedings Templates (论文排版格式) in the link (<http://www.ic-icc.cn/2026/Registration.php>) to obtain the information for preparing the final version of your paper. Note that for your camera-ready paper, you should first write your FULL given Names, and then write your FULL Family names, which is an international convention. In addition, the paper length of **12** pages for EACH paper in Springer format will be strictly enforced. If your paper is over the stipulated Maximum length, you will have to pay the

over-length page fee at \$200 USD or ¥1540 RMB (\$200*7.7) per extra page.

3. For each paper/poster, **Plagiarism Detection Rate must be less than 15%**. Otherwise, your paper will be excluded into the proceedings. So each camera-ready paper/poster has to be detected by any Plagiarism detection software before you are uploading to our online system.

When you have completed revising your paper and are ready to submit it, please go to the link http://www.ic-icc.cn/icg/fir_editor.php?identity=Rgistration to submit your final camera-ready paper. On this page you will need to use the following account and password:

Account: 528319209@qq.com

Password: Fuying@@2002

Final papers MUST be submitted before **May 12, 2026**. The paper must be re-submitted even if the reviewers indicated that no changes are required.

3. For each paper/poster, at least one of the authors for EACH paper must register for the conference. The deadline for author registration is **May 12, 2026**.

Particularly, please write **ICIC2026 + Paper ID Number** on the **BANK** transfer receipt when you are paying for a registration fee for your paper.

4. To be published in the conference proceedings, all accepted papers must be accompanied by a signed copyright form by downloading it from the **"Camera-ready Submission"** section of your personal account. Before submitting your final camera-ready paper, on the copyright form please write your Paper Title, Authors List, etc. and upload its scanned copy (in PDF format) together with the electronic bank transfer form (in PDF format) by <http://www.ic-icc.cn/2026/Registration.php>.

5. Hotel reservation information is available on the ICIC 2026 website very soon. Please keep an eye on <http://www.ic-icc.cn/2026/What's%20New.php> and book your room as early as possible!

If you require a visa to enter China please send a request for an invitation letter to Prashan Premaratne, University of Wollongong, Australia at prashan@uow.edu.au. Thank you for participating in ICIC2026. We look forward to seeing you in Toronto, Canada, July 22-26, 2026.

Thank you very much for your support to ICIC 2026.

Sincerely,

ICIC2026 Program Committee

REVIEWERS' COMMENTS

REVIEW NO. 1 (Turn 1)

Originality: 5

Significance of topic: 5

Technical quality: 5

Relevance to ICIC 2026: 5

Presentation: 5

Overall rating: 5

Reviewer's expertise on the topic:

Comments to the authors:

This paper proposes a graph collaborative filtering framework with hypergraph augmentation and contrastive learning for miRNA-drug association prediction. While the methodological novelty is moderate and mainly based on integrating existing techniques, the experimental evaluation is comprehensive and well-executed. The paper includes extensive comparisons, ablation studies, and cold-start evaluations, which strengthen its empirical contribution. Overall, the work is solid and meets the requirements for publication in a CCF-C conference. 1) The method integrates multiple existing components collaborative filtering, hypergraph learning, contrastive learning, with limited novelty. 2) The geodesic feature augmentation introduces some originality but is still based on prior work. 3) The experimental evaluation is comprehensive, including ablation studies and cold-start scenarios. 4) The performance improvement over baselines is relatively small, indicating incremental gains. 5) Statistical significance analysis e.g., p-values is missing and should be added. 6) The work is more application-driven, with limited theoretical analysis.

REVIEW NO. 2 (Turn 1)

Originality: 3.5

Significance of topic: 3.5

Technical quality: 4

Relevance to ICIC 2026: 4

Presentation: 4

Overall rating: 3.8

Reviewer's expertise on the topic:

Comments to the authors:

This manuscript proposes GCFH-MDA, a graph collaborative filtering framework with auxiliary hypergraphs for miRNA-drug association prediction. The method integrates multimodal node attributes and biologically informed regulatory information, constructs both local and global hypergraph views, and further incorporates geodesic feature augmentation and contrastive learning to enhance representation quality. Experiments under five-fold cross-validation demonstrate that the proposed method achieves competitive performance compared with existing approaches, and case studies further suggest its potential utility in identifying biologically relevant miRNA-drug associations. 1. The ablation study in Section 3.3 is somewhat brief. A more fine-grained analysis of individual components would help better clarify their respective contributions. 2. The manuscript states that contrastive learning aligns the two views. However, Section 2.5 defines two separate contrastive losses for the regulatory and embedding perspectives, and the formulation appears to emphasize local-global alignment within each perspective rather than explicit cross-view alignment. The authors are encouraged to clarify this point to improve the consistency between the textual description and the model formulation. 3. In Section 2.4, the manuscript states that B denotes the set of boundary nodes. However, the criterion for constructing B is not clearly specified. The authors may consider explicitly defining how B is determined. 4. At the beginning of Section 3 Results, the description of the experimental setup is somewhat brief. The manuscript currently reports only the PyTorch version and GPU type, while other important implementation details, such as the Python CUDA environment, optimizer settings, batch size, learning rate, training epochs, and random seed, are not clearly specified. The authors are encouraged to provide a more complete experimental configuration to improve reproducibility. 5. Although Fig. 1 summarizes the

overall workflow, the subsequent method description is not sufficiently linked to the figure. The authors may consider more explicitly referring to Fig. 1 when introducing each module to improve clarity and readability. 6. The order of figure citations in the main text seems inconsistent, as Fig. 4 is introduced before Fig. 3. The authors may consider checking the figure callout order for better presentation. 7. The presentation of Fig. 7 appears slightly inconsistent with the other figures, as its title caption seems to be placed above the figure. The authors may consider checking the layout and keeping the caption placement consistent throughout the manuscript for better presentation. 8. The clarity of the figures should be improved, labels and text within the figures are blurred and not sufficiently legible. The authors may consider providing higher-resolution versions of the figures to enhance readability and overall presentation.

REVIEW NO. 3 (Turn 1)

Originality: 4

Significance of topic: 4

Technical quality: 4

Relevance to ICIC 2026: 4

Presentation: 4

Overall rating: 4

Reviewer's expertise on the topic:

Comments to the authors:

This paper presents GCFH-MDA, a sophisticated and well-structured framework for miRNA-drug association prediction. The core idea of integrating dual-view hypergraph augmentation with geodesic feature refinement is novel and well-motivated, especially for mitigating hub bias and capturing high-order collaborative patterns in sparse biological networks. I appreciate that the authors effectively leverage biological priors without compromising predictive precision: the method achieves a superior AUC of 96.64 on benchmark datasets while substantially outperforming seven state-of-the-art baselines. The paper is clearly written, the ablation studies are thorough, and the case studies on anticancer drugs are convincing. Overall, this is a valuable and timely contribution to the field of computational biology, and I recommend acceptance.

REVIEW NO. 4 (Turn 1)

Originality: 4

Significance of topic: 5

Technical quality: 4

Relevance to ICIC 2026: 5

Presentation: 3.5

Overall rating: 4.3

Reviewer's expertise on the topic:

Comments to the authors:

1. The framework diagram is unclear, and Figure 3-7 is also unclear. 2. Insufficient evidence for the cold-start experiment. No comparison with other models is provided. Moreover, the cold-start experimental metric for drugs is only 83.34 ± 9.83 . Without knowing the performance of other models, how can the conclusion of promising potential be drawn? 3. It is recommended to add a table for the comparative experiments. From the figure, the advantages of the proposed model over other models are not very obvious. 4. For the legend, False Positive Rate and True Positive Rate should be abbreviated as FPR and TPR.

Sincerely Yours
ICIC 2026 Organization Committee
